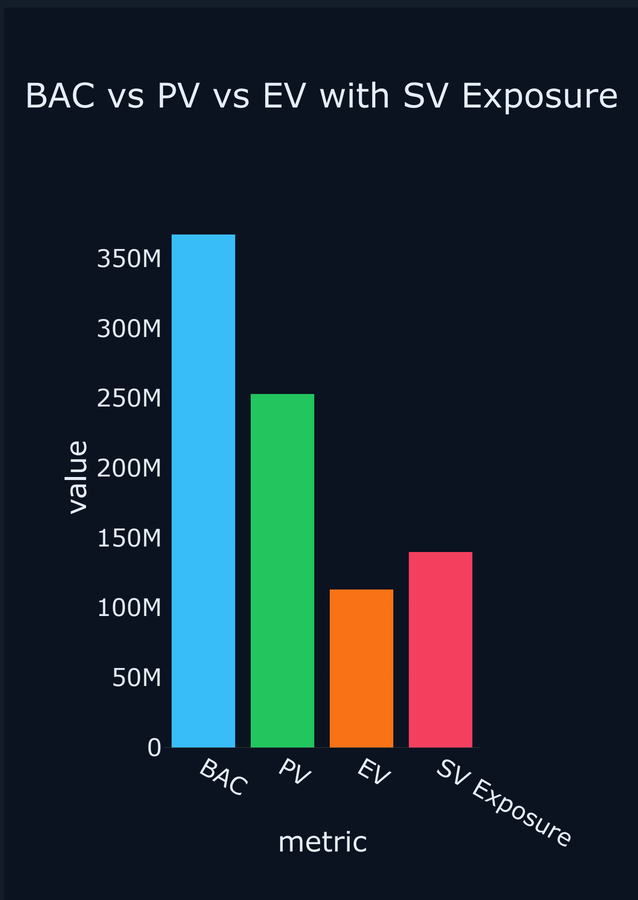
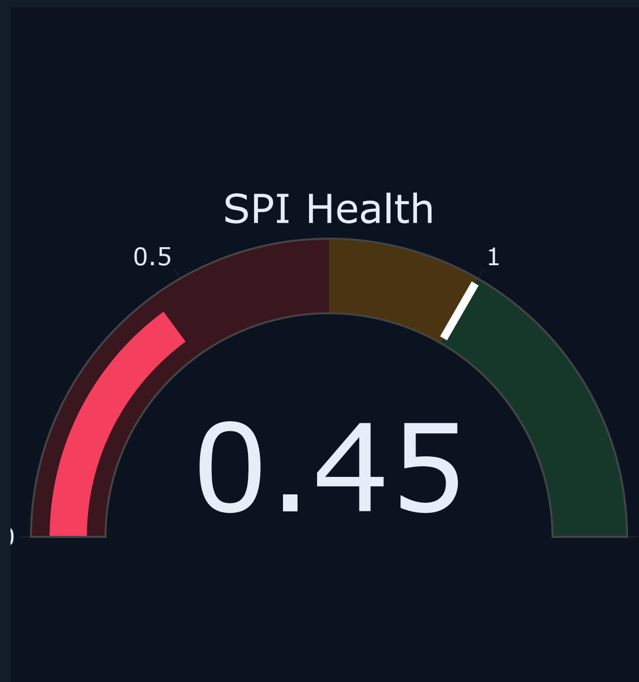
SCHEDULE HEALTH CLASSIFICATION

Critical Delay

Executive status





The project is underperforming against the planned value baseline. The earned value is significantly below the planned value, creating a negative schedule variance of SAR 139.71M and an SPI of 0.45. This indicates that the project is progressing at approximately 45% of the planned schedule efficiency.

EARNED VALUE ANALYSIS ADD-ON

Root Cause Linkage

CAUSE TITLE	IMPACT AREA	LINK TO EVM IMPACT	STATUS	SEVERITY
Delay in RFT steel supply by Owner	Procurement / Construction	PV not converted into EV due to blocked work fronts and delayed material-driven execution.	Ongoing	Critical
Delay in design review process	Engineering	Planned engineering progress could not flow into approved deliverables and downstream earned value.	Closed	High
Delay in reply on RFI 4 and RFI 5	Engineering / Construction	Technical closure delays restricted workface release and slowed conversion of planned progress into earned progress.	Ongoing	High
Delay in determining the MEP executing party	Engineering / Procurement / Construction	Interface uncertainty delayed execution planning, procurement flow, and forecast progress realization.	Closed	Medium
Payment delay impact on resource continuity and productivity	Commercial / Construction	Liquidity pressure reduced productivity continuity and slowed the conversion of planned value into earned value.	Ongoing	High

The negative schedule variance is not an isolated numerical deviation. It is directly linked to unresolved external and interface-driven constraints that prevented planned progress from being converted into earned value, mainly within construction and procurement work fronts.

EARNED VALUE ANALYSIS ADD-ON

Contractor Mitigation & Recovery Status

ACTION	OWNER / RESPONSIBLE PARTY	CURRENT STATUS	RECOVERY IMPACT	REQUIRED NEXT DECISION
RFT Steel Supply Recovery	Project Controls / Procurement / Owner Interface	In Progress	Releases blocked structural work fronts and supports EV generation in construction.	Secure committed steel release and delivery sequence from Owner.
RFI Closure Acceleration	Engineering Team / Consultant Interface	In Progress	Enables technical closure and unblocks affected planned activities.	Escalate overdue RFI responses for closure dates.
Design Review Follow-up	Engineering Management	Monitoring	Protects planned engineering completion and downstream procurement readiness.	Freeze review turnaround commitments with reviewing parties.
MEP Interface Finalization	Project Management / Client Interface	Monitoring	Reduces interface uncertainty and improves forecast execution reliability.	Confirm final executing responsibility and interface release logic.
Commercial / Payment Follow-up	Commercial Team	In Progress	Supports resource continuity and mitigates productivity disruption risk.	Close outstanding payment approvals and release under-payment invoices.
Construction Productivity Recovery	Construction Team	Ready Upon Constraint Removal	Accelerates EV generation once technical and supply constraints are removed.	Approve recovery sequence by priority work front.

Contractor mitigation is focused on protecting available work fronts, accelerating technical closures, maintaining commercial entitlement records, and recovering productivity once external constraints are removed. Recovery remains dependent on timely closure of outstanding Owner / Engineer-driven constraints.
